How to track changes

- Add your initials by `\definechangesauthor` above `\begin{document}`.
  Pick your favourite color: `https://en.wikibooks.org/wiki/LaTeX/Colors`
- This is how you add[HN] text:
  `\added[id=HN]{add}`
- This is how you add (with comment) text:
  `\added[id=HN, remark={comment}]{add (with comment)}`
- This is how you ~~delete~~[HN] text:
  `\deleted[id=HN]{delete}`
- This is how you ~~delete (with comment)~~ text:
  `\deleted[id=HN, remark={comment}]{delete (with comment)}`
- This is how you make a note :
  `\note[id=HN]{A note}`
- This is how you replace~~relapce~~[HN] text:
  `\replaced[id=HN]{relapce}{replace}`
- This is how you replace (with comment)~~relapce (wthi coment)~~ text:
  `\replaced[id=HN, remark={mis-spelled}]{relapse}{replace}`
- All markups can be removed by changing the header to `\usepackage[final]{changes}` later.

[HN 1] comment

[HN 2] comment

[HN 3] A note

[HN 4] mis-spelled

Abstract. This is the place for an abstract.

1. Introduction

This is the place for introduction.

1.1. **Subsection.** TEST TEST TES

Example text:

We shall consider the specific transport property ϕ and note that its spatial and temporal variation is governed by a second-order partical differential equation (PDE), viz.

$$\frac{\partial}{\partial t}(\rho\phi) + \nabla\cdot(\rho\phi\mathbf{U}) - \Gamma_\phi\nabla^2\phi - S_\phi(\phi) = 0. \tag{1.1}$$

Herein, $\phi = \phi(\mathbf{x}, t)$ is an arbitrary general intensive physical quantitity, e.g., a fluid property (scalar or tensor of any rank). Thus, (1.1) is often referred to as generic transport equation.

OpenFOAM® (Open Field Operation And Manipulation) is a flexible and mature C++ Class Library for Computational Continuum Mechanics (CCM) and Multiphysics. Its Object-Oriented-Programming (OOP) paradigm enables to *mimic data types and basic operations* of CCM using top-level syntax as close as possible to the conventional mathematical notation *for tensors and partial differential equations*:

```
1 solve
2 (
3   fvm::ddt(rho,Phi)
4   + fvm::div(phi, Phi)
5   - fvm::laplacian(Gamma, Phi)
6  ==
7   Sphi
```

Received by the editors xx.xx.202x.

TABLE 1. Finite Volume Notation

implicit differential operators	
rate of change	$\left[\!\left[\frac{\partial[\rho\phi]}{\partial t}\right]\!\right]$
convection term	$\left[\!\left[\nabla\bullet\left(F[\phi]_{f(F,S,\gamma)}\right)\right]\!\right]$
diffusion term	$[\![\nabla\bullet(\Gamma\nabla[\phi])]\!]$
linear part of source term	$[\![S_p\,[\phi]]\!]$
explicit differential operators	
temporal term	$\frac{\partial\rho\phi}{\partial t}$
divergence term	$\nabla\bullet(\rho\mathbf{U}\phi_{f(\rho\mathbf{U},S,\gamma)})$
laplacian term	$\nabla\bullet(\Gamma\nabla\phi)$
constant part of source term	S_u

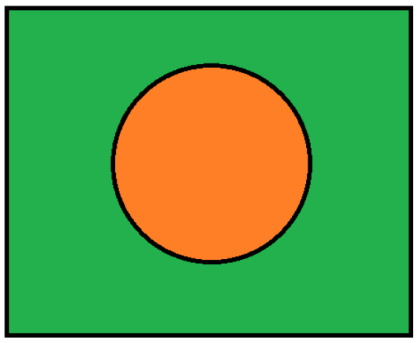

FIGURE 1. Examplary figure

```
);
```

Beside providing OpenFOAM code itself, spatial and temporal discretisation of Eq. 1.1 can be also described in a precise and concise manner using the finite-volume notation [1] - see Tab. 1.

2. Theoretical backgroud

Text in this section. Here is an examplary figure 1.

3. Conclusion

This is a conclusion.
